Tutorial Problem 1 [17-07-2019—23-07-2019]

$A[1..m]$ and $B[1..n]$ are two 1D arrays containing m and n integers respectively, where $m \leq n$. We need to construct a *sub-sequence* $C[1..m]$ of B such that $\sum_{i=1}^m |A[i] - C[i]|$ is minimized.

1. Develop the recurrences needed for DP, with clear arguments.
2. Design the algorithm and write the pseudo-code.
3. Demonstrate your algorithm on a few input instances.
4. Derive the time and space complexities of your algorithm.

Example

Let $A = \begin{bmatrix} 2 & 7 & 2 \end{bmatrix}$ and $B = \begin{bmatrix} 5 & 3 & 6 & 8 \end{bmatrix}$.

Possible cases:

1. $C = \begin{bmatrix} 3 & 6 & 8 \end{bmatrix}$
 $A = \begin{bmatrix} 2 & 7 & 2 \end{bmatrix}$
sum = $1 + 1 + 6 = 8$.
2. $C = \begin{bmatrix} 5 & 6 & 8 \end{bmatrix}$
 $A = \begin{bmatrix} 2 & 7 & 2 \end{bmatrix}$
sum = $3 + 1 + 6 = 10$.
3. $C = \begin{bmatrix} 5 & 3 & 8 \end{bmatrix}$
 $A = \begin{bmatrix} 2 & 7 & 2 \end{bmatrix}$
sum = $3 + 4 + 6 = 13$.
4. $C = \begin{bmatrix} 5 & 3 & 6 \end{bmatrix}$
 $A = \begin{bmatrix} 2 & 7 & 2 \end{bmatrix}$
sum = $3 + 4 + 4 = 11$.

So, here the solution is $C = \begin{bmatrix} 3 & 6 & 8 \end{bmatrix}$.

L^AT_EX in Ubuntu

1. To install L^AT_EX in Ubuntu, use the following command:
`sudo apt-get install texlive-full`
 2. Open an editor like `gedit` or `kile`.
 3. Create a file using that editor, say with the name `a.tex`, with the following content.
-

```
\documentclass{article}
\title{Tutorial 1}
\date{17-07-2019}
\author{Your name (and roll number)}

\begin{document}
\maketitle

\section{Problem Statement}

\end{document}
```

4. Compilation command: `pdflatex a.tex`
It will create the output file named `a.pdf`.
5. Open `a.pdf` in some pdf viewer.
It will look as shown in the next page!
